## QUIZ 2 (Section-B)

Date: October 31, 2018

Marks: 50

Time: 30 min.

**Q1. a.** Suppose we want to implement a Boolean function  $X_1 \wedge \neg X_2 \wedge X_3$  with a single neuron. Calculate the appropriate threshold assuming the weights to be  $W_1 = 1$ ,  $W_2 = -2$  &  $W_3 = 1$ . The truth table of the function is given below. (10)

Truth Table

$X_1$	$X_2$	$X_3$	$X_1 \wedge \neg X_2 \wedge X_3$
0	0	0	0
0	0	1	0
0	1	0	0
0	1	1	0
1	0	0	0
1	0	1	1
1	1	0	0
1	1	1	0

**b.** What would be the bias weight for this problem, if bias (with a constant input of -1) is used instead of threshold? (5)

**Q2.** For the following network, find the new weight  $w_{ki}$  (new) by the delta rule. Activation Functions of both neurons “i” and “j” are linear, i.e.  $y = \text{activation}$ . The learning rate is 0.1. The training pair is [2; 3]; i.e. input = 2 and output = 3. The current weights are shown on the links. There is only one input “k” and only one output “j”. The hidden layer has one neuron “i”. The node “k” is not a neuron and just passes on the input without any processing or modification. (25)

## QUIZ 2 (Section-B)

Date: October 31, 2018

Marks: 50

Time: 30 min.

---

Given Data/Hint:

According to the generalized delta rule, the hidden weight change is governed by:

$$\Delta w_{ki} = w_{ki}(\text{new}) - w_{ki}(\text{old})$$

$$\Delta w_{ki} = -c[-2\sum_j \{(y_j(\text{desired}) - y_j(\text{actual})) f'(\text{act})_j w_{ij}\} f'(\text{act})_i x_k]$$

For the above problem, there is only one output neuron (i.e. "j" = 1). Hence the Equation becomes

$$w_{ki}(\text{new}) = w_{ki}(\text{old}) - c[-2\sum_j \{(y_j(\text{desired}) - y_j(\text{actual})) f'(\text{act})_j w_{ij}\} f'(\text{act})_i x_k]$$

We have the following given values:

$$w_{ki}(\text{old}) = 3, c = 0.1, y_j(\text{desired}) = 3, w_{ij} = -2, x_k = 2$$

**Q3.** Represent the following as a GP tree. [e raise to power  $-(\lambda * A)$ ] (10)

Equation: 
$$Y = [2 / \{1 + e^{-(\lambda * A)}\}] - 1$$

Where  $A = (W_1 * X_1) + (W_2 * X_2)$ .

The  $W_i$ ,  $X_i$ , and  $\lambda$  are variables
